

DANEMARK AARHUS

WINTER : THE HARBOURS OF THE BALTIC SEA

In Scandinavia, the marine merchant activity is very extensive, and it is important to ensure that the logistics do not fail because of low temperatures in winter. This winter, FLEXELEC manufactured and supplied heating cables to frost protect the ball/joints and the hydraulic system of the loading cranes in the Danish harbours.

FLEXELEC and its Danish partners have designed and adapted the installation of trace heating systems to the huge mobile cranes.

The severe characteristics such as icy winds, temperatures below -15°C , salty environment, and presence of fuel are an example of difficulties met, and which the **FLEXTRACE[®] FTSH/TF 50W/m** performs with high efficiency.

The trouble shooting work that FLEXELEC and its partners have performed has reduced considerably the interruptions, whilst servicing the ships.
